

Digital To TV: HDTV DVB-S2 receiver for your Cable TV system

Adding **HDTV channels** to your Cable TV network using **DT-302** is **easy and cost-effective**. Most of the HDTV content available nowadays is coming from satellite. Because of the higher bit rate of the high definition TV programmes this type of services are normally allocated in satellite transponders using 8PSK modulation (DVB-S2).

The **DT-302** dual DVB-S2 receivers have TS-ASI output so you can have full flexibility to interface with modulators you may already have in your Cable TV system.

Thanks to the CAM interface available in the **DT-302**'s it is also possible to **decrypt the HDTV channels** right at the headend.

More information about this option and other functions of the **Digital To TV** solution is available at:
