MENU INTRODUCTION

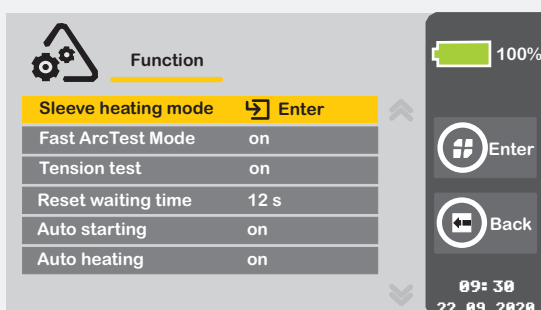

Function:	Set the parameters of some system functions such as heating mode, arc compensation, reset time, etc.
Splice Mode:	Set the parameters of splice mode.
Maintain:	Electrode maintenance, arc correction, calibration, etc.
System:	Set the display parameters, system language & time, restore to initial settings, etc.
History:	Record of number of arc times, splice results, etc.
Help:	Provide key operation manual.

SPLICE MODE MENU

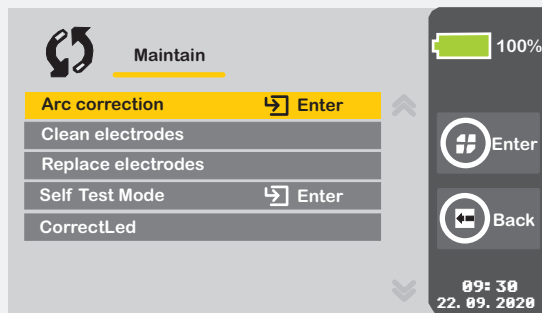

Fiber type:	Set according to the type of fibre used such as SM (single mode), MM (Multimode), DS (Dispersion shifted), NZDS (Non-zero dispersion shifted). Each fibre type can have up to 30 fusion splice pre-set programs. Other available fibre types are BIF (Bend Insensitive Fibre), UBIF (Ultra-Bend Insensitive Fibre), EDF (Erbium Doped Fibre) and G.657B3 (Bend Insensitive Single-Mode fibres).
Splice Operate Mode:	Automatic, Semi-automatic or Manual.
Splice Program No.:	30 groups preset splice program and 80 groups of users-set splice program.
Edit Splice Program:	Edit splice parameters under the current number of program.
Clean Arc Time:	It cleans dust on the fiber surface by short-time arc. The duration ranges from 0 to 200 ms.
Surface Angle Threshold:	An error message is displayed if the head face angle of either left or right side of fiber exceeds the angle threshold. The setting range is 0-8°.
Fiber Angle Threshold:	An error message is displayed if the clamp angle of the two fibers spliced exceeds the angle threshold. The setting range is 0-4°.
Align Offset Threshold:	An error message is displayed if the misalignment of the two fibers spliced exceeds the misalignment limit. The setting range is 0.0-1.5 µm.
Loss Threshold:	An error message is displayed if the estimated splice loss exceeds the loss limit. The setting range is 0-0.2db.
Compensation arc Time:	Splice loss may be improved by compensative arc in some cases.
Fiber Alignment Mode:	Cladding align or core align can be set.
Fast Splice Mode:	If it is "on" it accelerates the alignment.
Forced splice mode:	If it is in "on" mode, it will force the splice even if the fibre is not correctly cut (disregarding losses).

FUNCTION SETTINGS MENU

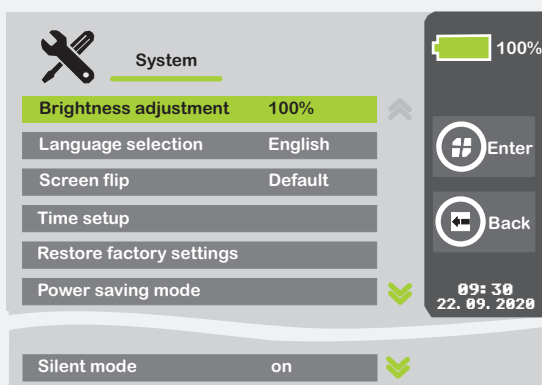

Sleeve heating mode:	Set the sleeve heating time.
Fast ArcTest Mode:	If this is set "on", after splice is completed, the equipment adjusts arc current and tension test.
Tension Test:	If this is set "on", after splice is completed, the equipment will restore and Tension test will perform itself.
Reset Waiting Time:	If the Tension test is set "off", the system will restore the equipment after the waiting time is over.
Auto Starting:	If it is set "on", it will perform a splice itself when the cover is closed.
Auto Heating:	If it is set "on", it starts heating when the cover is lid.

MAINTENANCE MENU

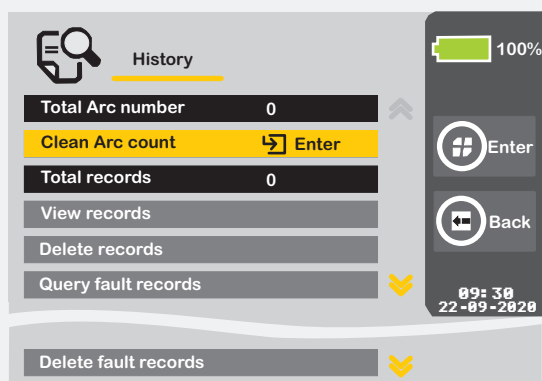

- Arc correction:** It performs an arc test and correction.
- Clean Electrodes:** It repeats short arc several times to clean the electrodes.
- Replace electrodes:** After replace electrodes, repeats short arc several times to stabilize the electrodes and to measure the electrodes position.
- Selt Test Mode:** It measures the electrodes position, motor and other system parameters automatically.
- CorrectLed:** When there is sudden change of temperature it may appear fog on the camera lens. Use this option to clear fog.

SYSTEM AND FUNCTION SETTINGS

- Brightness Adjustment:** Adjust the display brightness.
- Language Selection:** Select language.
- Screen Flip:** Screen rotates 180°.
- Time Setup:** Set system time and date.
- Restore Factory Settings:** Restore all parameters to factory settings.
- Power Saving Mode:** Set auto sleep or shutdown.
- Silent Mode:** Turn on or off the key beep.

SPLICE RESULTS STORAGE AND QUERY

- Total Arc Number:** Electrodes arc times since the last record is eliminated.
- Reset Arc Count:** Eliminate arc times after electrodes are replaced.
- Total Records:** The splice records having been stored by system.
- View Records:** 3000 groups of the latest splice records can be viewed. Users could query the splice parameters and results.
- Delete Records:** Delete all splice records.
- Query fault records:** It shows data about fault records.
- Delete fault records:** It deletes fault records.
